Phishing Email Detection & Awareness Report

Prepared By: Keerthan CS
Track: Cyber Security (Future Interns)

1. Threat Analysis: Sample 1 (Credential Harvesting)

- **Classification:** Phishing (High Risk)
- **Phishing Indicators:** Urgent tone threatening account suspension, fake spoofed domain (`paypal-support-update.com`), and a malicious IP link.
- **Business Impact:** If an employee clicks the link and enters their credentials, attackers can hijack corporate accounts, leading to data breaches.

2. Threat Analysis: Sample 2 (Malware Payload)

- **Classification:** Suspicious / Potential Malware (High Risk)
- **Phishing Indicators:** Unexpected attachment with a double extension (`Invoice_Q3.pdf.exe`) and a generic greeting ("Dear Customer").
- **Business Impact:** Executing the attachment could deploy ransomware across the corporate network.

3. Employee Prevention Guidelines

- Always expand the sender's name to check the actual email address. Look for slight misspellings.
- Hover your mouse over any links to preview the actual destination URL before clicking.
- Never download unexpected attachments, especially those ending in `.exe` or `.zip`.
- If an email feels urgent, threatening, or too good to be true, do not interact with it. Forward it immediately to the IT Security team.
